

Offsite Data Backup

Did you know that data loss costs U.S. businesses billions of dollars each year? Did you know that nearly 50 percent of small and medium-sized businesses that are directly affected by a fire or natural disaster go out of business within 5 years? Whether you've considered it or not, your company's data may be its most valuable resource and is, most likely, critical to its survival. That is why it is so important to take every measure possible to protect and preserve that resource.

"Offsite data backup means fewer headaches for me. Data for our business is no longer lost."

**– Bev Strauser,
Country Fresh Onions**

Why Choose MIS?

Why choose MIS as your Offsite Backup provider? The answer is simple. We store the past six weeks of data on our servers, but we don't stop there. We also offer monthly and annual archiving. With MIS you get a quality service from professionals who know your business and treat you right. Call us about our Offsite Data Backup services and start protecting your business today!

What is ODB?

Offsite backup is similar to a traditional backup except that, instead of storing your files on tape, your data is sent over the Internet to our secure backup servers. Offsite Data Backup enables you to conduct your data backups, ensuring they are performed reliably and stored securely outside of the walls of your facility with point and click on-demand data recovery. Your data is encrypted for security and privacy and compressed to save space and transmission time, which enables you to use our online backup with either a dialup or high-speed Internet connection. With either monthly or annual service, offsite backup takes the worry and hassle out of data backup. It's faster, cheaper and more reliable than using tapes or other forms of media, which means more time for you to tend to your business and more money in your pocket.
